QUALITY ASSURANCE STATEMENT

The Product Safety Laboratories' Quality Assurance Unit reviewed this study for adherence to PSL's Standard Operating Procedures, the study protocol, and all applicable GLP standards. This final report was found to be an accurate representation of the work conducted. Records of QA findings are kept on file. The summary below provides verification of statements made in the final report section that addresses Quality Assurance audits.

QA activities for this study:

QA Activity	Date Conducted	Date Findings Reported To Study Director And Management
Protocol review	1/26/04 ¹ , 2/11/05	1/26/04, 2/14/05
In-process inspection: <i>Day 2 in-life observations</i>	12/23/04	2/14/05
Raw data audit	2/11/05	2/14/05
Draft report review	2/11/05	2/14/05
Final report review	3/10/05	3/10/05

Louise N. Caruso, B.S.
Quality Assurance Auditor
Product Safety Laboratories

¹ PSL's "generic" protocol used for this study was reviewed by the Quality Assurance group on this date.

ACUTE INHALATION TOXICITY STUDY IN RATS - LIMIT TEST

PROTOCOL NO.: P330

AGENCY: EPA (FIFRA)

STUDY NUMBER: 16449

SPONSOR: ARCH ANGEL LLC
636 Hampshire, Suite 208
Quincy, IL 62301

TEST SUBSTANCE IDENTIFICATION: Stalosan F
Lot #1 Batch 63

TEST SUBSTANCE DESCRIPTION: Pinkish powder

DATE RECEIVED: November 8, 2004

PSL REFERENCE NO.: 041108-3D

STUDY INITIATION DATE: November 15, 2004

DATES OF TEST: December 21, 2004 - January 4, 2005

NOTEBOOK NO.: 04-94: pages 226-264

1. PURPOSE

To provide information on health hazards likely to arise from a short-term exposure to Stalosan F by the inhalation route.

2. SUMMARY

An acute inhalation toxicity test was conducted with rats to determine the potential for Stalosan F to produce toxicity via the inhalation (nose-only exposure) route. Under the conditions of this study, the single exposure acute inhalation LC₅₀ of the test substance is greater than 2.07 mg/L in male and female rats.

After establishing the desired generation procedures during pre-test trials, ten healthy rats (5/sex) were exposed to the test atmosphere for 4 hours. Chamber concentration and particle size distributions of the test substance were determined periodically during the exposure period. The animals were observed for mortality, signs of gross toxicity, and behavioral changes at least once daily for 14 days following exposure. Body weights were recorded prior to exposure and again on Days 7 and 14 (termination). Necropsies were performed on all animals at terminal sacrifice.

All animals survived exposure to the test atmosphere and gained body weight over the 14-day observation period. The gravimetric chamber concentration was 2.07 mg/L. Based on graphic analysis of the particle size distribution as measured with an Andersen Cascade Impactor, the mass median aerodynamic diameter was estimated to be 2.8 μm .

All animals appeared active and healthy over the entire 14-day observation period following exposure. There were no signs of gross toxicity, adverse pharmacologic effects, or abnormal behavior. No gross abnormalities were noted for any of the animals when necropsied at the conclusion of the 14-day observation period.

3. MATERIALS

A. Test Substance

The test substance, identified as Stalosan F, Lot #1 Batch 63, was received on November 8, 2004 and was further identified with PSL Reference Number 041108-3D. The test substance was a pinkish powder and was stored at room temperature. Prior to aerosolization, the test substance was ground in a ball mill for 24 hours and then in a coffee mill (Krupps, Model 203). Documentation of the methods of synthesis, fabrication, or derivation of the test substance is retained in Denmark.

The following information related to the characterization of the test substance was provided by the Sponsor unless otherwise noted:

Composition: not given

pH: 3.5 (as a 1% w/w solution) ¹

Solubility: Slightly soluble in water.

Stability: Test substance was expected to be stable for the duration of testing.

Expiration Date: Not applicable.

B. Animals

3.B.1 Number of Animals: 10

3.B.2 Sex: 5 Males and 5 Females. Females assigned to test were nulliparous and non-pregnant.

3.B.3 Species/Strain: Rat/Sprague-Dawley derived, albino.

3.B.4 Age/Body weight: Young adult (8-9 weeks)/males 223-245 grams and females 176-200 grams at experimental start.

3.B.5 Source: Received from Ace Animals, Inc., Boyertown, PA on December 14, 2004.

¹ As determined by Product Safety Laboratories (from PSL study numbers 16446 and 16445 for the active ingredient and pH, respectively).

4. METHODS

A. Husbandry

- 4.A.1 Housing: The animals were singly housed in suspended stainless steel caging with mesh floors which conform to the size recommendations in the most recent *Guide for the Care and Use of Laboratory Animals DHEW (NIH)*. Litter paper was placed beneath the cage and was changed at least three times per week.
- 4.A.2 Animal Room Temperature Range: 19-23°C
- 4.A.3 Photoperiod: 12-hour light/dark cycle
- 4.A.4 Acclimation Period: 7 days
- 4.A.5 Food: Purina Rodent Chow #5012
- 4.A.6 Water: Tap water was supplied *ad-libitum* by an automatic water dispensing system except during exposure.
- 4.A.7 Contaminants: There were no known contaminants reasonably expected to be found in the food or water at levels which would have interfered with the results of this study. Analyses of the food and water are conducted at least once a year and the records are kept on file at Product Safety Laboratories.

B. Identification

- 4.B.1 Cage: Each cage was identified with a cage card indicating at least the study number and identification and sex of the animal.
- 4.B.2 Animal: A number was allocated to each rat on receipt and a stainless steel ear tag bearing this number was attached to the rat. This number, together with a sequential animal number assigned to study 16449, constituted unique identification.

5. PROCEDURE

A. Pre-Test Trials

Prior to initiation of the full inhalation study, pre-test trials were conducted to establish generation procedures to achieve, to the extent possible, the desired chamber concentration (2.0 mg/L) and desired particle size distribution (mass median aerodynamic diameter less than or equal to 4 µm). In these trials, the following adjustments were made in an attempt to achieve these objectives:

Air Pressure:	constant
Compressed Generator Airflow:	constant
Compressed Mixing Airflow:	constant
Total Airflow:	constant
Motor Setting:	varied
Dust Generating System:	constant
Cutting Head:	constant
Cutting Blade:	constant

Packing Pressure: constant
Material Preparation: constant

The procedures and aerosolization equipment used in the full test were based on the results of pre-test trial number 2. This provided a chamber concentration of 2.03 mg/L and a mass median aerodynamic diameter of 2.8 μm . The test substance used in trial number 2 (as well as the full test) was ground first for 24 hours in a ball mill and then in a coffee mill then prior to aerosolization.

B. Inhalation Procedures

The exposure chamber, air supply and equipment used to measure particle size distribution, airflow and chamber concentration were the same as used during the pre-test trials and are described below.

- 5.B.1 **Nose-Only Exposure Chamber:** A nose-only inhalation chamber with an internal volume of approximately 6.7 liters (Mini-Nose Only Inhalation Chamber, ADG Developments LTD) was used for exposure. Animals were individually housed in polycarbonate holding tubes which seal to the chamber with an "O" ring during exposure. The base unit terminates the chamber with a 0.5-inch diameter tube for discharged air.
- 5.B.2 **Air Supply:** Approximately 30 liters per minute (Lpm) of filtered air was supplied by an air compressor (JUN-AIR, Model #6-15) to the dust generator. An additional 3.3 Lpm of compressed mixing air, supplied using dry filtered air from a compressed air tank (WELCO) which was introduced into the chamber to help uniformly distribute the test atmosphere by creating a vortex at the chamber inlet. Compressed airflow was measured with a Mass Flowmeter (Omega, Model #FMA 5613). Chamber airflow was monitored throughout the exposure period and recorded periodically. Total airflow ranged from 31.6 to 31.9 with a mean of 31.7 Lpm. Based on the volume of the inhalation chamber, this airflow provided approximately 284 air changes per hour during the study.
- 5.B.3 **Ambient Conditions:** The exposure tube temperature and relative humidity ranges during exposure were 21-22° C and 41-48%RH, respectively. The room temperature and relative humidity ranges during exposure were 21° C and 32-40%RH, respectively. In-chamber measurements were made with a Humidity-Temperature Indicator (Taylor, Model #5502) and room conditions were measured with a Temperature-Humidity Monitor (Dickson, Model #TH550). Temperature and relative humidity values were recorded every 15 minutes for the first hour of exposure and every 30 minutes thereafter.
- 5.B.4 **Test Substance Preparation:** The test substance was processed in a 1.6-gallon urethane-lined milling jar (Abbethane, Paul O'Abbe) with porcelain grinding media (0.5" balls) for 24 hours. After milling, the ground test substance was sieved through a $\frac{3}{8}$ " polyethylene sieve and further ground in a coffee mill (Krupps, Model 203).
- 5.B.5 **Dust Generation:** The test substance was aerosolized using a modified Wright Dust Generator driven by a variable speed motor (Dayton, Model #4Z538A). The test substance was packed into the dust container (Wright, Model DF 183) and compressed to 400 lbs/in² using a lab press (Carver, Model C). The container was then fitted with a stainless steel cutting head (Model DF 194SS) and cutting blade (Model DF 191SS).

Compressed air was supplied to the dust generator at 30 psi. The aerosolized dust was then fed directly into the chamber through the dust outlet assembly.

- 5.B.6 Chamber Concentration Measurements: Gravimetric samples were withdrawn at 6 intervals from the breathing zone of the animals. Samples were collected using 25 mm glass fiber filters (GF/B Whatman) in a filter holder attached by ¼ inch tygon tubing to a vacuum pump (Reliance Electric, Model #G557X). Filter papers were weighed before and after collection to determine the mass collected. This value was divided by the total volume of air sampled to determine the chamber concentration. The collections were carried out for 2 minutes at airflows of 4 Lpm. Sample airflows were measured using a Mass Flowmeter (Omega, Model #FMA 5610).
- 5.B.7 Particle Size Distribution: An eight-stage Andersen cascade impactor was used to assess the particle size distribution of the test atmosphere. Samples were withdrawn from the breathing zone of the animals at two intervals. The filter paper collection stages were weighed before and after sampling to determine the mass collected upon each stage. The aerodynamic mass median diameter and geometric standard deviation were determined graphically using two-cycle logarithmic probit axes.
- 5.B.8 Exposure Period: The animals were exposed to the test atmosphere for 4 hours and 1 minute. The exposure period was extended beyond 4 hours to allow the chamber to reach equilibrium (T_{99}). The times for 90 and 99% equilibration of the chamber atmosphere were 0.5 and 1.0 minute, respectively. At the end of the exposure period, the generation was terminated and the chamber was operated for a further 15 minutes with clean air. At the end of this period the animals were removed from the exposure tube. Prior to being returned to their cages, excess test substance was removed from the fur of each animal.

C. Selection of Animals

On the day of and prior to exposure, the rats were examined for health and weighed. Ten healthy rats (five males and five females) were selected for test.

D. Body Weights

Individual body weights of the animals were recorded prior to test substance exposure (initial) and again on Days 7 and 14 (termination).

E. Cage-Side Observations

The animals were observed for mortality, signs of gross toxicity and behavioral changes prior to exposure, at least every 30 minutes during exposure, upon removal from the exposure chamber and at least once daily thereafter for 14 days. Observations included gross evaluation of skin and fur, eyes and mucous membranes, respiratory, circulatory, autonomic and central nervous systems, somatomotor activity and behavior pattern. Particular attention was directed to observation of tremors, convulsions, salivation, diarrhea and coma.

F. Necropsy

All rats were euthanized via CO₂ inhalation on Day 14. Gross necropsies were performed on all animals. Tissues and organs of the thoracic and abdominal cavities were examined.

6. STUDY CONDUCT

This study was conducted at Product Safety Laboratories, 725 Cranbury Road, East Brunswick, New Jersey 08816. The primary technician for this study was Jasbir Bawa, B.S. This study was conducted to comply with the Good Laboratory Practice (GLP) regulations as defined in:

- 40 CFR 160: U.S. EPA GLP Standards: Pesticide Programs (FIFRA)

and in accordance with:

- U.S. EPA Health Effects Test Guidelines, OPPTS 870.1300 (1998)

7. QUALITY ASSURANCE

The final report was audited for agreement with the raw data records and for compliance with the protocol, Product Safety Laboratories Standard Operating Procedures and appropriate Good Laboratory Practice Standards. Dates of inspections and audits performed during the study and the dates of reporting of the inspection and audit findings to the Study Director and Facility Management are presented in the Quality Assurance Statement.

8. DEVIATIONS FROM FINAL PROTOCOL

None

9. FINAL REPORT AND RECORDS TO BE MAINTAINED

The original, signed final report will be forwarded to the Sponsor. A copy of this signed report, together with the protocol and all raw data generated at Product Safety Laboratories, is maintained in the Product Safety Laboratories Archives. PSL will maintain these records for a period of at least five years. After this time, the Sponsor will be offered the opportunity to take possession of the records or will be charged an archiving fee for continued archiving by PSL.

10. RESULTS

Details of all pretest exposure trials are described in Tables 1 through 3. A summary of test exposure information is presented in Tables 4 through 6. Individual body weights, and cage-side and necropsy observations are presented in Tables 7 through 9, respectively.

All animals survived exposure to the test atmosphere and gained body weight over the 14-day observation period. The gravimetric and nominal chamber concentrations were 2.07 and 15.31 mg/L, respectively. Based on graphic analysis of the particle size distribution as measured with an Andersen Cascade Impactor, the mass median aerodynamic diameter was estimated to be 2.8 µm.

All animals appeared active and healthy over the entire 14-day observation period following exposure. There were no signs of gross toxicity, adverse pharmacologic effects, or abnormal behavior. No gross abnormalities were noted for any of the animals when necropsied at the conclusion of the 14-day observation period.

11. CONCLUSION

Under the conditions of this study, the single exposure acute inhalation LC_{50} of Stalosan F is greater than 2.07 mg/L in male and female rats.
